

Intelligence Score UI Roadmap

Current Status: Phase 5 Complete (PR #135)
Last Updated: July 4, 2026

✓ Phase 5: Core Component (Shipped)

What’s Live

- Reusable `IntelligenceScore` component
- Full card view with per-source breakdown
- Compact inline badge variant
- Color-coded scoring (emerald → blue → amber → orange)
- Integrated in Test Case Lab and Script Gen

User Impact

Before: “AI-generated” with no proof
After: “94% grounded in repository intelligence, 6% AI-assisted”
Sales Impact: Clients immediately understand this isn’t another AI wrapper.

🎯 Phase 5.1: Enhanced Messaging (High ROI)

1. Better Wording Framework

Current:

Intelligence Score

🧠 94% grounded

🌟 6% AI Assisted

Source Breakdown:

Repository Match95%

App Profile92%

Enhanced:

Intelligence Score

Grounded by:

✓ Repository Match95%

✓ App Profile92%

✓ Existing Patterns98%

AI Assisted:

6%

Why: “Grounded by” is clearer for executives. Makes the sources feel like features, not metrics.

Effort: 2-3 hours

Value: High (demo clarity)

Priority: Medium

Phase 5.2: Clickable Source Details (Very High ROI)

Vision

Make each source **expandable** to show which specific artifacts grounded the generation.

Current:

Repository Match 95%

Enhanced (Expandable):

Repository Match 95% ▼

Used:

- ✓ LoginPage.ts (page object)
- ✓ AuthHelper.ts (helper method)
- ✓ credentials.json (test data)
- ✓ Login.spec.ts (pattern reference)

Demo Power: During demos, click to expand and show **exactly** which files were used. Clients immediately understand why the score is 95%.

Implementation:

- Add `details?: string[]` to `IntelligenceScore.bySource` (backend extension)
- Add expand/collapse state to component
- Render file/method list when expanded

Effort: 1 day (backend) + 4 hours (UI)

Value: Very High (demo wow factor)

Priority: High

Blocker: Requires backend to return artifact details

Phase 5.3: Badge System (Future Enhancement)

Vision

Intelligence Score influences **visual badges** that provide instant quality assessment.

Examples:

98% grounded
★★★★★ Enterprise **Ready**

84% grounded
 Repository Grounded

62% grounded
 AI Heavy

Badge Tiers:

- 95%+: ★★★★★ "Enterprise Ready"
- 85-94%: ★★★★☆ "Repository Grounded"
- 70-84%: ★★★☆☆ "Good Coverage"
- 50-69%: ★★☆☆☆ "AI Heavy"
- <50%: △ "Needs Grounding"

Where to Show:

- Intelligence Score card
- Generation history tables
- Dashboard metrics
- Export reports

Effort: 4-6 hours

Value: Medium-High (visual clarity)

Priority: Medium

Dependency: Phase 5 complete

Phase 5.4: Healing Integration

Current Status

Deferred from Phase 5 to keep PR focused.

What's Needed

Backend:

1. Extend `HealingContextResult` interface in `src/services/healing-intelligence-context.ts` :

```
typescript
export interface HealingContextResult {
  // ... existing fields
  intelligenceScore?: IntelligenceScore; // ← Add this
}
```

1. Update `HealingIntelligenceContext.load()` to extract and return score:

```
typescript
return {
  // ... existing fields
  intelligenceScore: intel.metadata?.intelligenceScore,
};
```

2. Pass through healing worker result chain to API response

Frontend:

4. Add `intelligenceScore` to healing result types
5. Render `<IntelligenceScore />` in healing results view

Example Output:

Healing Intelligence	
Repository Match	96%
Method Index	100%
DOM Match	92%
AI Assisted	0%
Overall Score	98%

Why Powerful: Shows clients that healing is nearly 100% grounded in real code, not AI guessing.

Effort: 1 day (backend) + 2 hours (UI)

Value: High (healing transparency)

Priority: High

Dependency: Phase 3 (PR #222) merged

Phase 5.5: Design Refinements (Long-term)

Things to AVOID

Per user feedback, do NOT add:

- ❌ Radar charts
- ❌ Pie charts
- ❌ Spider graphs
- ❌ Heatmaps

Keep it simple. Current design is perfect.

Things to CONSIDER

- Micro-animations on score reveal (subtle)
- Accessibility improvements (ARIA labels, keyboard navigation)
- Dark/light theme variants
- Export intelligence score to PDF reports
- Historical trend view (score over time)

Effort: TBD

Value: Low-Medium

Priority: Low

Metrics & Success Criteria

How to Measure Success

Sales Metrics:

- Demo conversion rate (before/after Intelligence Score feature)
- Client questions about “AI vs. grounded” (should decrease)
- Feature mentions in win/loss interviews

Product Metrics:

- Average intelligence score across all generations
- % of generations with >90% grounding
- Feature usage (how often clients view/expand scores)

Engagement Metrics:

- Time spent on Intelligence Score panel
 - Click-through rate on expandable sources (Phase 5.2)
 - Badge visibility in dashboards (Phase 5.3)
-

Recommended Sequencing

Based on user feedback and ROI:

Immediate (Next 2 Weeks)

1. **Phase 5.2: Clickable Source Details** — Very High ROI for demos
2. **Phase 5.4: Healing Integration** — Complete the orchestrator story

Short-term (1-2 Months)

1. **Phase 5.3: Badge System** — Visual clarity
2. **Phase 5.1: Enhanced Messaging** — “Grounded by” wording

Long-term (3+ Months)

1. **Phase 5.5: Design Refinements** — Polish
-

Strategic Context

Per user feedback:

“From this point onward, I would shift about **70% of your effort toward customers** and **30% toward engineering.**”

“You’re no longer building isolated features — you’ve built a coherent QA intelligence platform. Now it’s time to validate it in the market and let customer feedback drive the next wave of capabilities.”

Implication: Intelligence Score enhancements should be driven by **customer demos** and **real-world usage**, not theoretical improvements.

Process:

1. Ship Phase 5 (complete)

2. Run customer demos
 3. Collect feedback on Intelligence Score
 4. Prioritize roadmap based on what resonates
 5. Iterate
-

Success Indicators

You'll know this feature is succeeding when:

- ✓ **Sales:** CTOs say "this proves it's not just another AI wrapper"
 - ✓ **Product:** Average intelligence score stays >85% (high grounding)
 - ✓ **Engineering:** No customer confusion about what the score means
 - ✓ **Competitive:** Competitors start copying the transparency metric
-

Open Questions

For Customer Discovery:

1. Do clients understand the per-source breakdown?
2. Do they want to see **which files** were used? (validates Phase 5.2)
3. Do they care more about the **overall score** or **individual sources**?
4. Would badges (★★★★★) add clarity or confusion?
5. How important is historical trend data (score over time)?

For Engineering:

1. Can backend efficiently return artifact details for clickable sources?
 2. Should we cache intelligence scores for performance?
 3. How do we handle edge cases (score = 0%, score = 100%)?
-

Deliverables Summary

Phase	Status	Effort	Value	Priority
5.0 Core Component	✓ Shipped	1 day	Very High	—
5.1 Enhanced Messaging	📋 Planned	2-3 hrs	High	Medium
5.2 Clickable Details	📋 Planned	1.5 days	Very High	High
5.3 Badge System	📋 Planned	4-6 hrs	Medium-High	Medium
5.4 Healing Integration	📋 Planned	1 day	High	High
5.5 Design Polish	💡 Future	TBD	Low-Med	Low

Next Actions

Immediate:

1. ✓ Merge PR #135 (Phase 5.0)
2. ✓ Deploy to production
3. Run customer demos with Intelligence Score feature
4. Collect feedback

This Week:

5. Start Phase 5.2 (Clickable Source Details) if customer feedback is positive
6. Start Phase 5.4 (Healing Integration) after PR #222 merges

This Month:

7. Implement top 2 customer-requested enhancements
8. Document Intelligence Score in customer-facing documentation
9. Create demo video showing Intelligence Score in action

This roadmap is a living document — update it based on customer feedback and market validation.
